                 This sequence represents novel infection-specific protein IncA of Chlamydia trachomatis LGV-434 (serotype L2). IncA is found in the inclusion membrane of infected cells. It is associated primarily with the vegetative reticulate body form of Chlamydia rather than with the refractile elementary body form. The invention includes: a

                                                                                                                                   AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, nonendemic trachoma, nongenococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, batholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

                                                                                  AAY36754-127949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis. See AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and Thozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsable for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as perihepatitis, epidymitis, cervicitis, salpingitis, perihepatitis, barthollinitis; penemopathy in breast feeding infants; may be of use in treating these diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chlamydia psittaci strain GPIC. IncA is found in the inclusion membrane of infected cells. It is associated primarily with the vegetative reticulate body form of Chlamydia rather than with the refractile elementary body form. The invention includes: a vaccine directed against the reticulate body form of Chlamydia comprising or more infection-specific proteins (see AAY32170-78), including or more infection specific proteins (see AAY32170-78), including nethods for detection of infection-specific antipodies or antigens in a biological specimen; and a method of using therapeutic agents specifically directed against infection-specific peptides, or the genes that code for such peptides, to treat chlamydial infection.
                                                                                                                                                                                                                                                                                                                       Gaps

                     AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, shnusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584.Y35879) can be used inmunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

AAR ARR72829 is human mitosin. Mitosin is involved in the regulation of the mammalian mitotic cell cycle. Mitosin as with E2F-1 (see AAR72824) conteracts with the retinoblastoma protein (the retinoblastoma tumour interacts with the retinoblastoma protein (the retinoblastoma tumour conteracts with the retinoblastoma tumour conteracts with the retinoblastoma tumour contents, is chosely associated with the centromeres/Kinetochores at the mitosic, is closely associated with the centromeres/Kinetochores at the mitotic spindle poles. Mitosin is necessary for a cell to mitotic cell to mitotic cell to conter the M phase of the mitotic cell cycle and its degradation is necessary for a cell to advance on to the next stage. Mitosin is thus contenting the M phase.

Consecul for controlling cell growth as overexpression of mitosin prevents a call from exiting the M phase.

Consecul for mitosin antibody, antibody fragment or a phosphorylated mitosin antien (or nucleic acid encoding it) can also be used to inhibit cell division which is particularly useful for the study of the cell cycle.

A further use is to control hyperproliferative cells, and so control alseases such as psoriasis and breast cancer. It can also be used to control control myperproproliferative cells, and so control control myperproliferative cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    127 -TSKDLSAVS----QDFYSCLQGFRDNYKGFESLLDEYKNSTEEMRKL-----FSQEIIA 176

```

This is the amino acid sequence for mitosin, a phosphoprotein necessary for the cell to ente mitosis. The protein's degradation is also necessary for the cell to advance into the next stages of mitosis. The mitosin protein, can be used to control the growth of cells. An can inhibit the mitotic cell cycle by preventing the cells from entering can inhibit the mitotic cell cycle by preventing the cells from entering can inhibit the mitosin of mitosin or its functional equivalent, would inhibit the cycle by preventing cells from entering equivalent, would inhibit the cycle by preventing cells from leaving the M phase. Antagonists to this protein can be used to control hyperproliferative cells in, (e.g. thyroid hyperplasis, Grave's disease, cancer, sarcomas and other neoplasms, bladder cancer, colon cancer, cancer and various leukaemias and lymphomas). Reintroduction or control concleto and other neoplasms, bladder cancer, colon cancer, colon cancer, canced encoding the protein into a cell can restore defective chromosome segregation, which is a marker of progressing malignancy.

Can also be used for the detection and diagnosis of hyperproliferative

It is the product of a cDNA clone (AAT34578) isolated from a breast carchioma cDNA library. Recombinant CENP-F can be produced by expression in prokaryotic or eukaryotic host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176 ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

'n,
immunogenic protein is useful for preventing, reducing or ameliorating immediate hypersensitivity condition such as atopic dermatitis, immediate hypersensitivity, systemic anaphylaxis, allergic rhinitis or asthma and for modulating an immune response directed to Bt allergen in directed to all or a part of Bt allergen in a biological sample from a subject. The Bt allergens are also useful for detecting antibody subject. Antibodies to Bt allergen in a biological sample from subject. Antibodies to Bt allergens are also used as therapeutic or diagnostic agents, to screen Bt immunoassays and as antagonists to inhibit Bt activity under circumstances where temporary hypersensitivity inhibition is required. The present sequence is Btll allergen.

ŝ
allergen, is derived from domestic mite, Blomia tropicalis. The specific limmunogenic protein is useful for preventing, reducing or ameliorating blomia tropicalis hypersensitivity condition such as atopic dermatitis, immediate hypersensitivity, condition such as atopic dermatitis, asthma and for modilating an immune response directed to Bt allergen in a subject. The Bt allergens are also useful for detecting antibody clirected to all or a part of Bt allergen in a blological sample from a subject. Antibodies to Bt allergens are also used as therapeutic or diagnostic agents, to screen Bt immunoassays and as antagonists to inhibit Bt activity under circumstances where temporary hypersensitivity inhibition is required. The present sequence is Btll allergen.

The present invention relates to immunogenic proteins, referred as Bt allergen, is derived from domestic mite, Blomia tropicalis. The specific bt allergens of the invention includes Btl1, Btl0, Bt5 and BtA2. The immunogenic protein is useful for preventing, reducing or ameliorating immunogenic protein is useful for preventing, reducing or ameliorating immunogenic protein is useful for preventing, reducing or ameliorating an immune response directed to Bt allergen in asthma and for modulating an immune response directed to Bt allergen in a subject. The Bt allergens are also useful for detecting antibody directed to all or a part of Bt allergen in a biological sample from a cubject. Antibodies to Bt allergens are also used as therapeutic or diagnostic agents, to screen Bt immunoassays and as antagonists to inhibit Bt activity under circumstances where temporary hypersensitivity inhibition is required. The present sequence is a protein encoded

                                                                                                                                                                                                                                                     The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rho protein-binding activity; protein kinase activity; inhibitor; smooth muscle fibre formation; smooth muscle contraction; circulatory disease; treatment; tumour formation; metastasis inhibitor; autoinmune disease; platelet aggregation inhibitor.

The present sequence represents a protein that has Rho protein-binding activity and protein kinase activity. Inhibitors of the Rho-binding protein kinase can be used to inhibit smooth muscle fibre formation and smooth muscle contraction. Other applications of the Rho protein-binding agent and its' products are as a circulatory disease treating agent, a tumour formation or metastasis inhibitor, an autolmmune disease treating agent or a platelet aggregation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LOKTANLHLYQDLQREVGSLK-EINFMLSVLQKEFLHLSKEFATTSKDLSAVSQDFYSCL 142

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence 11, Apsequence 15, A sequence 1, Apsequence 1, Apsequence 1, Apsequence 12, A sequence 12, A sequence 12, A sequence 1, Apsequence 1, Apsequence 1, Apsequence 17, A sequence 11, A sequence 11,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   outer layer protein VP3 - human rotavirus A (serotype 2 strain 1076)
N;Alternate names: hemagglutinin
N;Contains: outer capsid protein VP5; outer capsid protein VP8
C;Species: human rotavirus A
C;Date: 30-Jun-1990 #sequence_revision 30-Jun-1990 #text_change 01-Mar-1996
C;Accession: F28839

A.Description: The sequence of C. elegans cosmid F59A6.
A.Reference number: 218526
A.Accession: T16507
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Molecule type: DNA
A.Molecule type: DNA

01.CCT-2001 (Rel. 40, Last annotation update)
01.CCT-2001 (Rel. 40, Last hannaggluthin) (Outer layer protein VP4)
(Contains: Outer capsid proteins VP5 and VP8].
                                                                                                                                                  DNA SEQ. 7:11-82(1997).

DNA SEQ. 7:11-82(1997).

- FUNCTION: MAY PLAY AN IMPORTANT ROLE IN SPERMATOGENESIS AND/OR

- FESTIS DEVELOPMENT. PROBABLY IDENTICAL WITH THE SEROLGGICALLY

TESTIS DEVELOPMENT. HIGHLY EXPRESSED IN TESTIS. TRANSCRIPTS CAN

- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN TESTIS. TRANSCRIPTS CAN
FOUND IN SPERMATIDS DURING SPERMATOGENESIS. NO EXPRESSION IN
EXPIGE CELLS, SPERMATOGONIA, OR SPERMATOCYTES.

- STMILARITY: HIGH, TO HUMAN GOLGIN-160.

- CAUTION: IT IS UNCERTAIN WHETHER MET-1, MET-19 OR MET-30 IS THE
"Cloning and molecular characterization of cDNA encoding a mouse male-enhanced antigen-2 (Mea-2): a putative family of the Golgi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   42;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8.6%; Score 115; DB 1; Length 1325;

Submitted (JAN-1994) to the EMBL/GenBank/DDBJ databases.

-I-FUNCTION: LAMINS ARE COMPONENTS OF THE NUCLEAR LAMINA, A FIBROUS
MAICH IS THOUGHT TO PROVIDE A FRAMEWORK FOR THE NUCLEAR MEMBRANE,

-I-SUBCELLULAR LOCATION: NUCLEAR ENVELOPE

-I-PUNSTHEE FORMS OF LAMIN HAVE BEEN IDENTIFIED IN D.MELANOGASTER,

-I-PUNSTHEE FORMS OF LAMIN HAVE BEEN IDENTIFIED IN D.MELANOGASTER,

-I-PUNSTHEER FORMS OF LAMIN HAVE BEEN IDENTIFIED IN D.MELANOGASTER,

-I-PUNSTHORY: BELONGY TO THE NUCLEAR ENVELOPE AND IS THEN

PHOSPHORYLATED. FORMING LAMIN DM2.

-I-SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
